<b>EXP.NO:1(a)</b>	<b>BASIC C PROGRAMMING-PRACTICE</b>
<b>DATE:</b>	

### **QUESTION:**

Given two numbers, write a C program to swap the given numbers.

**For example:**

<b>Input</b>	<b>Result</b>
10 20	20 10

### **PROGRAM:**

```
#include<stdio.h>

int main()
{
    int a, b, t;

    scanf("%d %d", &a, &b);

    t=a;
    a=b;
    b=t;

    printf("%d %d", a, b);

    return 0;
}
```

**OUTPUT:**

	Input	Expected	Got	
✓	10 20	20 10	20 10	✓

<b>EXP.NO:1(b)</b>	<b>BASIC C PROGRAMMING-PRACTICE</b>

### **QUESTION:**

Write a C program to find the eligibility of admission for a professional course based on the following criteria:

Marks in Maths  $\geq 65$

Marks in Physics  $\geq 55$

Marks in Chemistry  $\geq 50$

Or

Total in all three subjects  $\geq 180$

### **Sample Test Cases**

#### **Test Case 1**

#### **Input**

70 60 80

#### **Output**

The candidate is eligible

### **PROGRAM:**

```
#include<stdio.h>

int main()
{
    int m,p,c;

    scanf("%d %d %d",&m,&p,&c);

    int t=m+p+c;

    if(m>=65 && p>=55 && c>=50){

        printf("The candidate is eligible");
    }
    else if(t>=180){

        printf("The candidate is eligible");
    }
}
```

```
else{  
    printf("The candidate is not eligible");  
}  
}
```

**OUTPUT:**

	Input	Expected	Got	
✓	70 60 80	The candidate is eligible	The candidate is eligible	✓
✓	50 80 80	The candidate is eligible	The candidate is eligible	✓

<b>EXP.NO:1(c)</b>	<b>BASIC C PROGRAMMING-PRACTICE</b>
<b>DATE:</b>	

### **QUESTION:**

Malini goes to BestSave hyper market to buy grocery items. BestSave hyper market provides 10% discount on the bill amount B when ever the bill amount B is more than Rs.2000.

The bill amount B is passed as the input to the program. The program must print the final amount A payable by Malini.

Input Format:

The first line denotes the value of B.

Output Format:

The first line contains the value of the final payable amount A.

Example Input/Output 1:

Input:

1900

Output:

1900

Example Input/Output 2:

Input:

3000

Output:

2700

### **PROGRAM:**

```
#include<stdio.h>
int main(){
    int c, t;
    scanf("%d",&c);
    if(c>2000){
        t=c-(c*0.1);
    }
    else{
        t=c;
    }
    printf("%d",t);
}
```

**OUTPUT:**

	Input	Expected	Got	
✓	1900	1900	1900	✓
✓	3000	2700	2700	✓

<b>EXP.NO:1(d)</b>	<b>BASIC C PROGRAMMING-PRACTICE</b>
<b>DATE:</b>	

### **QUESTION:**

Baba is very kind to beggars and every day Baba donates half of the amount he has when ever a beggar requests him. The money M left in Baba's hand is passed as the input and the number of beggars B who received the alms are passed as the input. The program must print the money Baba had in the beginning of the day.

#### **Input Format:**

The first line denotes the value of M.

The second line denotes the value of B.

#### **Output Format:**

The first line denotes the value of money with Baba in the beginning of the day.

#### **Example Input/Output:**

Input:

100

2

Output:

400

### **PROGRAM:**

```
#include<stdio.h>
```

```
int main(){
```

```
    int m, b;
```

```
    scanf("%d", &m);
```

```
    scanf("%d", &b);
```

```
    int t=m*b;
```

```
    printf("%d", t*2);
```

```
}
```

**OUTPUT:**

	Input	Expected	Got	
✓	100 2	400	400	✓

<b>EXP.NO:1(e)</b>	<b>BASIC C PROGRAMMING-PRACTICE</b>
<b>DATE:</b>	

### **QUESTION:**

The CEO of company ABC Inc wanted to encourage the employees coming on time to the office. So he announced that for every consecutive day an employee comes on time in a week (starting from Monday to Saturday), he will be awarded Rs.200 more than the previous day as "Punctuality Incentive". The incentive I for the starting day (ie on Monday) is passed as the input to the program. The number of days N an employee came on time consecutively starting from Monday is also passed as the input. The program must calculate and print the "Punctuality Incentive" P of the employee.

#### **Input Format:**

The first line denotes the value of I.  
The second line denotes the value of N.

#### **Output Format:**

The first line denotes the value of P.

#### **Example Input/Output:**

Input:

500  
3

Output:

2100

### **PROGRAM:**

```
#include<stdio.h>
int main(){

    int a,d;

    scanf("%d",&a);

    scanf("%d",&d);

    int t=0;

    for(int i=0;i<d;i++)
    {
        a=a+200;
```

```
        t=t+a;
    }
    printf("%d",t-600);
}
```

**OUTPUT:**

	Input	Expected	Got	
✓	500 3	2100	2100	✓
✓	100 3	900	900	✓

<b>EXP.NO:1(f)</b>	<b>BASIC C PROGRAMMING-PRACTICE</b>
<b>DATE:</b>	

### **QUESTION:**

Two numbers M and N are passed as the input. A number X is also passed as the input. The program must print the numbers divisible by X from N to M (inclusive of M and N).

Input Format:

The first line denotes the value of M  
The second line denotes the value of N  
The third line denotes the value of X

Output Format:

Numbers divisible by X from N to M, with each number separated by a space.

Boundary Conditions:

1 <= M <= 99999999  
M < N <= 99999999  
1 <= X <= 9999

Example Input/Output 1:

Input:

2  
40  
7

Output:

35 28 21 14 7

### **PROGRAM:**

```
#include<stdio.h>
int main()
{
    int m,n,x;
    scanf("%d\n%d\n%d",&m,&n,&x);
    for(int i=n;i>=m;i--){
        if(i%x==0){
            printf("%d ",i);
        }
    }
}
```

}

**OUTPUT:**

	Input	Expected	Got	
✓	2 40 7	35 28 21 14 7	35 28 21 14 7	✓

<b>EXP.NO:3(a)</b>	<b>DIVIDE AND CONQUER</b>
<b>DATE:</b>	

### **PROBLEM STATEMENT:**

Given an array of 1s and 0s this has all 1s first followed by all 0s. Aim is to find the number of 0s. Write a program using Divide and Conquer to Count the number of zeroes in the given array.

Input Format

First Line Contains Integer m – Size of array

Next m lines Contains m numbers – Elements of an array

Output Format

First Line Contains Integer – Number of zeroes present in the given array.

### **PROGRAM:**

```
#include <stdio.h>

int main() {
    int m, i; scanf("%d",
    &m); int arr[m];
    for(i = 0; i < m; i++)
        { scanf("%d", &arr[i]);
    }
    int low = 0, high = m - 1, mid, firstZeroIndex = -1; while(low
    <= high) {
        mid = low + (high - low) / 2;
        if ((mid == 0 || arr[mid - 1] == 1) && arr[mid] == 0) { firstZeroIndex
            = mid;
            break;
        }
        if (arr[mid] == 1)
            { low = mid + 1;
        } else {
            high = mid - 1;
        }
    }
```

```
}
```

```
if (firstZeroIndex == -1) {
```

```
    printf("0\n");  
} else {  
    printf("%d\n", m - firstZeroIndex);  
}  
  
return 0;  
}
```

**OUTPUT:**

	Input	Expected	Got	
✓	5 1 1 1 0 0	2	2	✓
✓	10 1 1 1 1 1 1 1 1 1 1 1 1	0	0	✓

<b>EXP.NO:3(b)</b>	<b>DIVIDE AND CONQUER</b>
<b>DATE:</b>	

### **PROBLEM STATEMENT:**

Given an array nums of size n, return *the majority element*.

The majority element is the element that appears more than  $\lfloor n / 2 \rfloor$  times. You may assume that the majority element always exists in the array.

Example 1:

Input: nums = [3,2,3]

Output: 3

Example 2:

Input: nums = [2,2,1,1,1,2,2]

Output: 2

Constraints:

$n == \text{nums.length}$  1

$1 \leq n \leq 5 * 10^4$

$-2^{31} \leq \text{nums}[i] \leq 2^{31} - 1$

### **PROGRAM:**

```
#include <stdio.h>

<b>EXP.NO:3(c)</b>	<b>DIVIDE AND CONQUER</b>
<b>DATE:</b>	

### **PROBLEM STATEMENT:**

Given a sorted array and a value x, the floor of x is the largest element in array smaller than or equal to x. Write divide and conquer algorithm to find floor of x.

Input Format

First Line Contains Integer n – Size of array

Next n lines Contains n numbers – Elements of an array

Last Line Contains Integer x – Value for x

Output Format

First Line Contains Integer – Floor value for x

### **PROGRAM:**

```
#include <stdio.h>
```

```
int main() {
```

```
    int n, x;
```

```
    scanf("%d", &n);
```

```
    int arr[n];
```

```
    for (int i = 0; i < n; i++)
```

```
        { scanf("%d", &arr[i]);
```

```
    }
```

```
    scanf("%d", &x);
```

```
    int left = 0, right = n - 1;
```

```
    int floor = -1;
```

```

<b>EXP.NO:3(d)</b>	<b>DIVIDE AND CONQUER</b>
<b>DATE:</b>	

### **PROBLEM STATEMENT:**

Given a sorted array of integers say arr[] and a number x. Write a recursive program using divide and conquer strategy to check if there exist two elements in the array whose sum = x. If there exist such two elements then return the numbers, otherwise print as “No”.

Note: Write a Divide and Conquer Solution

Input Format

First Line Contains Integer n – Size of array

Next n lines Contains n numbers – Elements of an array

Last Line Contains Integer x – Sum Value

Output Format

First Line Contains Integer – Element1

Second Line Contains Integer – Element2 (Element 1 and Elements 2 together sums to value “x”)

### **PROGRAM:**

```
#include <stdio.h>
```

```
int main() {
```

```
    int n, x;
```

```
    scanf("%d", &n);
```

```
    int arr[n];
```

```
    for (int i = 0; i < n; i++)
```

```
        { scanf("%d", &arr[i]);
```

```
    }
```

```
    scanf("%d", &x);
```

<b>EXP.NO:4(a)</b>	<b>1-G-COIN PROBLEM</b>
<b>DATE:</b>	

### **QUESTION:**

Write a program to take value V and we want to make change for V Rs, and we have infinite supply of each of the denominations in Indian currency, i.e., we have infinite supply of { 1, 2, 5, 10, 20, 50, 100, 500, 1000} valued coins/notes, what is the minimum number of coins and/or notes needed to make the change.

Input Format:

Take an integer from stdin.

Output Format:

print the integer which is change of the number.

Example Input :

64

Output:

4

Explanaton:

We need a 50 Rs note and a 10 Rs note and two 2 rupee coins.

### **PROGRAM:**

```
#include <stdio.h>
```

```
int min_coins_and_notes(int V) {
```

```
    int denominations[] = {1000, 500, 100, 50, 20, 10, 5, 2, 1};
```

```
    int n = sizeof(denominations) / sizeof(denominations[0]);
```

```
    int count = 0;
```

```
    for (int i = 0; i < n; i++)
```

```
    { if (V == 0) {
```

```
        break;
```

```
    }
```

```
        count += V / denominations[i];
```

```
V %= denominations[i];
```

```
return count;

}

int main()
{ int V;

scanf("%d", &V);

printf("%d\n", min_coins_and_notes(V));

return 0;

}
```

**OUTPUT:**

	Input	Expected	Got	
✓	49	5	5	✓

<b>EXP.NO:4(b)</b>	<b>2-G-COOKIES PROBLEM</b>
<b>DATE:</b>	

### **QUESTION:**

Assume you are an awesome parent and want to give your children some cookies. But, you should give each child at most one cookie.

Each child  $i$  has a greed factor  $g[i]$ , which is the minimum size of a cookie that the child will be content with; and each cookie  $j$  has a size  $s[j]$ . If  $s[j] \geq g[i]$ , we can assign the cookie  $j$  to the child  $i$ , and the child  $i$  will be content. Your goal is to maximize the number of your content children and output the maximum number.

Example 1:

Input:

3  
1 2 3  
2  
1 1

Output:

1

Explanation: You have 3 children and 2 cookies. The greed factors of 3 children are 1, 2, 3.

And even though you have 2 cookies, since their size is both 1, you could only make the child whose greed factor is 1 content.

You need to output 1.

Constraints:

$1 \leq g.length \leq 3 * 10^4$

$0 \leq s.length \leq 3 * 10^4$

$1 \leq g[i], s[j] \leq 2^{31} - 1$

### **PROGRAM:**

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```

int compare(const void *a, const void *b) {

return (*(int *)a - *(int *)b);

}

int findContentChildren(int g[], int gSize, int s[], int sSize)

{ qsort(g, gSize, sizeof(int), compare);

qsort(s, sSize, sizeof(int), compare);

int childIndex = 0;

int cookieIndex = 0;

while (childIndex < gSize && cookieIndex < sSize)

{ if (s[cookieIndex] >= g[childIndex]) {

childIndex++;

}

cookieIndex++;

}

return childIndex;

}

int main() {

int gSize, sSize;

scanf("%d", &gSize);

int *g = (int *)malloc(gSize * sizeof(int));

if (g == NULL) {

fprintf(stderr, "Memory allocation failed\n");

return 1;

}

for (int i = 0; i < gSize; i++)

{ scanf("%d", &g[i]);

}

```

```
scanf("%d", &sSize);  
  
int *s = (int *)malloc(sSize * sizeof(int));  
  
if (s == NULL) {
```

```
    fprintf(stderr, "Memory allocation failed\n");

    free(g);

    return 1;

}

for (int i = 0; i < sSize; i++)

    { scanf("%d", &s[i]);

    }

printf("%d\n", findContentChildren(g, gSize, s, sSize));

free(g);

free(s);

return 0;

}
```

**OUTPUT:**

	Input	Expected	Got	
✓	2	12	12	✓
✓	1000	5002	5002	✓
✓	143	717	717	✓

<b>EXP.NO:4(c)</b>	<b>3-G-BURGER PROBLEM</b>
<b>DATE:</b>	

### **QUESTION:**

A person needs to eat burgers. Each burger contains a count of calorie. After eating the burger, the person needs to run a distance to burn out his calories.

If he has eaten  $i$  burgers with  $c$  calories each, then he has to run at least  $3^i * c$  kilometers to burn out the calories. For example, if he ate 3

burgers with the count of calorie in the order: [1, 3, 2], the kilometers he needs to run are  $(3^0 * 1) + (3^1 * 3) + (3^2 * 2) = 1 + 9 + 18 = 28$ .

But this is not the minimum, so need to try out other orders of consumption and choose the minimum value. Determine the minimum distance

he needs to run. Note: He can eat burger in any order and use an efficient sorting algorithm. Apply greedy approach to solve the problem.

Input Format

First Line contains the number of burgers

Second line contains calories of each burger which is  $n$  space-separate integers

Output Format

Print: Minimum number of kilometers needed to run to burn out the calories

Sample Input

```
3
5 10 7
```

Sample Output

```
76
```

### **PROGRAM:**

```
#include <stdio.h>

<b>EXP.NO:5(b)</b>	<b>PLAYING WITH CHESSBOARD</b>
<b>DATE:</b>	

### **QUESTION:**

Ram is given with an  $n \times n$  chessboard with each cell with a monetary value. Ram stands at the (0,0), that the position of the top left white rook. He is been given a task to reach the bottom right black rook position (n-1, n-1) constrained that he needs to reach the position by traveling the maximum monetary path under the condition that he can only travel one step right or one step down the board. Help ram to achieve it by providing an efficient DP algorithm.

Example:

Input

3

1 2 4

2 3 4

8 7 1

Output:

19

Explanation:

Totally there will be 6 paths among that the optimal is

Optimal path value:  $1+2+8+7+1=19$

Input Format

First Line contains the integer n

The next n lines contain the  $n \times n$  chessboard values

Output Format

Print Maximum monetary value of the path

### **PROGRAM:**

```
#include <stdio.h>

#define MAX 100

int max(int a, int b)
{
    return (a > b) ? a : b;

}

```

## OUTPUT

	Input	Expected	Got	
✓	aab azb	2	2	✓
✓	ABCD ABCD	4	4	✓

<b>EXP.NO:5(d)</b>	<b>LONGEST NON-DECREASING SUBSEQUENCE</b>
<b>DATE:</b>	

### **QUESTION:**

Problem statement:

Find the length of the Longest Non-decreasing Subsequence in a given Sequence.

Eg:

Input:9

Sequence: [-1,3,4,5,2,2,2,2,3]

the subsequence is [-1,2,2,2,2,3]

Output:6

### **PROGRAM:**

```
#include <stdio.h>
```

```
int longest_non_decreasing_subsequence(int arr[], int n)
```

```
{ int dp[n];
```

```
int max_length = 1;
```

```
for (int i = 0; i < n; i++)
```

```
{ dp[i] = 1;
```

```
}
```

```
for (int i = 1; i < n; i++)
```

```
{ for (int j = 0; j < i; j++)
```

```
{
```

```
if (arr[j] <= arr[i]) {
```

```
dp[i] = (dp[i] > dp[j] + 1) ? dp[i] : dp[j] + 1;}}
```

```
if (dp[i] > max_length) {
```

```

        max_length = dp[i];
    }
}

return max_length;
}

int main() {
    int n;
    scanf("%d", &n);
    int arr[n];
    for (int i = 0; i < n; i++)
        { scanf("%d", &arr[i]); }
    int result = longest_non_decreasing_subsequence(arr, n);
    printf( "%d\n", result);
    return 0;
}

```

**OUTPUT:**

	Input	Expected	Got	
✓	9 -1 3 4 5 2 2 2 2 3	6	6	✓
✓	7 1 2 2 4 5 7 6	6	6	✓

### **QUESTION:**

Find Duplicate in Array.

Given a read only array of n integers between 1 and n, find one number that repeats.

Input Format:

First Line - Number of elements

n Lines - n Elements

Output Format:

Element x - That is repeated

For example:

Input	Result
5 1 1 2 3 4	1

### **PROGRAM:**

```
#include <stdio.h>
```

```
int findDuplicate(int arr[], int n)
```

```
{ int slow = arr[0];
```

```
int fast = arr[arr[0]];
```

```
while (slow != fast)
```

```
{ slow = arr[slow];
```

```
fast = arr[arr[fast]];
```

```

    }

    fast = 0;

    while (slow != fast)

        { slow = arr[slow];

          fast = arr[fast];

        }

    return slow;
}

int main()

{ int n;

  scanf("%d", &n);

<b>EXP.NO:6(c)</b>	<b>PRINT INTERSECTION OF 2 SORTED ARRAYS-O(M+N)TIME COMPLEXITY,O(1) SPACE COMPLEXITY</b>
<b>DATE:</b>	

**QUESTION:**

Find the intersection of two sorted arrays.

OR in other words,

Given 2 sorted arrays, find all the elements which occur in both the arrays.

Input Format

· The first line contains T, the number of test cases. Following T lines contain:

1. Line 1 contains N1, followed by N1 integers of the first array
2. Line 2 contains N2, followed by N2 integers of the second array

Output Format

The intersection of the arrays in a single line

Example

Input:

1

3 10 17 57

6 2 7 10 15 57 246

Output:

10 57

Input:

1

6 1 2 3 4 5 6

2 1 6

Output:

1 6

For example:

Input	Result
1 3 10 17 57	10 57

Input	Result
6 2 7 10 15 57 246	

### **PROGRAM:**

```
#include <stdio.h>
```

```

<b>EXP.NO:6(e)</b>	<b>PAIR WITH DIFFERENCE-<math>O(N^2)</math> TIME COMPLEXITY, <math>O(1)</math> SPACE COMPLEXITY</b>
<b>DATE:</b>	

**QUESTION:**

Given an array A of sorted integers and another non negative integer k, find if there exists 2 indices i and j such that  $A[j] - A[i] = k$ ,  $i \neq j$ .

Input Format:

First Line n - Number of elements in an array

Next n Lines - N elements in the array

k - Non - Negative Integer

Output Format:

1 - If pair exists

0 - If no pair exists

Explanation for the given Sample Testcase:

YES as  $5 - 1 = 4$

So Return 1.

**For example:**

Input	Result
3	1
1 3 5	
4	

**PROGRAM:**

```

#include <stdio.h>
